EUROPE:
Now you can search ISI® data ON-LINE through ESA-SDS

You now can have immediate access via the ESA-SDS computer to 1,300 of the world's most important physics, chemistry and engineering journals—the same journals covered in the *Science Citation Index®*, *CC®/Physical & Chemical Sciences* and *CC/Engineering, Technology & Applied Sciences*.

Whether you're interested in—

- current awareness
- selective dissemination of information
- retrospective searching as far back as 1972

—the ESA-SDS computer will search the ISI data, find the information you want and deliver it *fast*.

All you need for this quick, on-line searching is a teletype or video-display terminal. You dial a number and are linked to the ESA-SDS central computer in Frascati, Italy.

ESA-SDS may be accessed by direct line with Frascati or by dialing through the PTT network to London, Brussels, Paris, Copenhagen, Darmstadt, or Rome. You can also dial via PTT lines to TYMESHARE in Brussels, Paris, Lausanne, London, or The Hague.

Find out more about how ISI data and ESA-SDS can make your literature searches faster, easier and more effective than ever before.

Mail the coupon below. Or contact David Raitt at the Space Documentation Service, ESA-SDS, Via Galilei, 00044 Frascati (Roma), Italy. Tel.: (Rome) 94 22 401; Telex: 61637 ESRINROM. Do it today.

Structural Theory of Organic Chemistry

By N.D. Epiotis, W.R. Cherry, S. Shaik, R.L. Yates, F. Bernardi

60 figures. Approx. 260 pages. 1977
Cloth DM 90,–; US $ 39.60
(Topics in Current Chemistry, Volume 70)
ISBN 3-540-08099-6
Prices are subject to change without notice

This work constitutes the first attempt to develop a new overview of structural chemistry based on quantum theory. A combination of qualitative molecular orbital theory and explicit quantum mechanical computations leads to the identification of the key factors controlling the shape of a molecule. On this basis, the experimentalist can anticipate structural trends for simple as well as complex molecules. In all cases, the theoretical principles are illustrated by reference to available experimental data. (420 references)

Microscope Photometry

79 figures, 8 tables. Approx. 400 pages. 1977
Cloth DM 68,–; US $ 30.00
ISBN 3-540-08094-5
Prices are subject to change without notice

The subject of this book is the whole field of photometric measuring of objects under the microscope. The detailed descriptions of apparatus and practical procedures are always based on a discussion of the theory. Its author has spent a quarter of a century in a large optical company where he has gained very extensive experience in all fields of applied optics.
Over the last decade there has been great development in instrumentation and methods for the study of microscopic objects by measuring their characteristic optical properties. The manufacturers have met the challange of scientific needs for research, both in the biological and in the non-biological field. Consequently this book comes at an opportune moment to give guidance, both in theory and practice, to workers in a wide range of scientific applications of microscope photometry.

Contents: General Introduction.–Ray Paths in the Microscope.–Transfer of Light Energy in the Optical System.–The Light Source and Its Power Supply.–Monochromatising Devices and Filters.–The Basic Microscope Assembly.–The Photometer System.–Adjustment of Equipment.–Procedures in Photometry with the Microscope.–Special Techniques in Microscope Photometry.–Special Adjustment for Photometry.–Systematic Measuring Errors.–Statistical Errors.–Application of Microscope Photometry.–Appendices 1-14.–References.–Subject Index.

Instructions to Authors

Manuscripts should be *submitted in duplicate*, typed in double-line spacing on one side of the paper only. Form and contents should be carefully checked to exclude the need for corrections in proof. The author should already mark in the manuscript where figures and tables are to be inserted, as he will receive only *one set of proofs* to correct typographical errors. Authors will be charged for corrections in proof involving changes, additions, or deletions to the original manuscript.

The papers should be preceded by an *English summary* of not more than 100 words. Papers not written in English should have an English translation of the title.

Immediately following the summary, a list of *Key words* (not exceeding five items normally) should be supplied for subject indexing.

Literature references should be numbered and listed at the end of the paper. They should be cited as follows: *journal papers* — names and initials of all authors, journal with abbreviations according to the I.U.P.A.C. list (Chemical Abstracts, Vol. 55, 1961), volume and page number, year in parentheses; *books* — names of authors, full title, edition, place, publisher and year. References should be cited in the text by number.

Figures, graphs, tables and structural formulae should be separated from the text and be numbered. Original drawings and graphs should be made in Indian ink with lines of uniform thickness. Authors should keep in mind that drawings will be reduced to a size not exceeding 12 × 19 cm. In general it should be assumed that the same degree of reduction will apply to all figures in the same paper. Inscriptions should allow for any reduction in scale — a capital letter should be about 1.8 mm in height in the final version. Computer print-outs should be black and evenly printed to allow direct reproduction.

Captions, which should be brief, should be typed separately and attached to the manuscript.

Formulae should be typewritten, special attention being given to the placing of indices and exponents to that they are recognizable as such even though there is no difference in size. Formulae should preferably be written in a "linear" form e. g. $\exp(-\varepsilon/kT)$ instead of $e^{\frac{\varepsilon}{kT}}$). It will help the printer if in doubtful cases the position of indices and exponents is marked thus: $b_{\wedge}$, $a^{\vee}$.

Underlining for special alphabets and typefaces should be done according to the following code:

violet:	numerals to be distinguished from letters (1, *l*; zero, *O*)		
single underlining:	small letter		
double underlining:	capital letter	red:	Greek
brown:	boldface	blue:	Gothic
yellow:	upright	green:	Script

The following are frequently confused:

$\cup, \cup, \bigcup, U$; $\circ, o, O, 0$; $\times, x, X, \varkappa$; $\vee, v, \nu$; $\theta, \Theta, \phi, \varphi, \Phi, \varnothing, \emptyset$; ψ, Ψ; $\varepsilon, \in$; a', a^1; the symbol *a* and the indefinite article a. Please take care to distinguish them in some way.
